

#### COLLEGE OF ENGINEERING School of Civil and Construction Engineering

# Precision and Bias Testing Electrical Resistivity and Formation Factor

September 27<sup>th</sup> – National Concrete Consortium

Siva Chopperla, Burkan Isgor, and Jason Weiss, Edwards Distinguished Professor, Oregon State University NATIONAL CONCRETE CONSORTIUM

Jason.Weiss@oregonstate.edu

Jason.Weiss@oregonstate.edu

- A large part of good concreting is doing what we already know
- We can control the capillary pores by controlling the w/c (SCM and WRA good)
- Excess water leads to pores and increased transport
- 'Low Hanging Fruit' all can reach
- Lower w/c general move in right direction

THINKES THAT	THINKS YOU
MATTER	CONTROL )
1	
WHAT YOU SHOULD	Fours ON

### **Concrete Durability FHWA – PEM Effort**

- AASHTO R101
  - Transport (and Corrosion): Resistivity/F Factor
  - Freeze-Thaw Durability:
     Critical Saturation Approach
  - Freeze-Thaw Durabilitiy: (SAM)
  - Calcium Oxychloride Reactivity
  - Shrinkage Cracking Dual Ring
  - Workability V Kelly
  - Workability Box

### **Quality Assurance and Quality Control**

![](_page_5_Picture_1.jpeg)

- Measurements during construction
- Owner: Is this the same mixture we qualified?
- Producer: Is this the mixture we want to produce?
- Test with good repeatability
- Easy tests allow for large sample size, statistical information as well

![](_page_5_Figure_7.jpeg)

![](_page_6_Picture_1.jpeg)

![](_page_6_Picture_2.jpeg)

![](_page_6_Figure_3.jpeg)

### A Few Issues (Fixable)

- Improper correction for geometry
- Not accounting for temperature
- Drift, cable damage, or improper size
- Importance and implication of sample
  - curing allowing microstructure in the sample to fully form/hydrate
  - conditioning allowing the pore solution to be well known
- Standards need to be followed for
  - accurate results
  - correct data interpretation

$$\rho = R_{\text{cylinder}} \left(\frac{A}{L}\right) \qquad \qquad \rho = \frac{R}{2\pi a}^* (\mathsf{f}_{\text{confinement}})$$

# Frank was not a specification follower

![](_page_8_Picture_1.jpeg)

![](_page_8_Picture_2.jpeg)

![](_page_8_Picture_4.jpeg)

# A lot done on resistivity over the last century

![](_page_9_Picture_1.jpeg)

- However, in many ways we are not considering what is known
- Are we too busy as this comic suggests
- Do we need to learn it for ourselves
- We are missing some basics that will hinder us in the long run
- Example reports and calls Jason.Weiss@oregonstate.edu

![](_page_9_Picture_7.jpeg)

![](_page_9_Figure_8.jpeg)

### A Few Issues (Fixable)

![](_page_10_Picture_1.jpeg)

- Improper correction for geometry
- Not accounting for temperature
- Drift, cable damage, or improper size
- Importance and implication of sample
  - curing allowing microstructure in the sample to fully form/hydrate
  - conditioning allowing the pore solution to be well known
- Standards need to be followed for
  - accurate results
  - correct data interpretation

![](_page_10_Picture_11.jpeg)

![](_page_10_Figure_12.jpeg)

![](_page_11_Picture_0.jpeg)

### **Keep Encouraging Training**

Current AASHTO standards need precision and bias statements that follow the standards and are conditioned per standard

**P&B** study

- Several round robin tests have been conducted (Spragg et al.2012)
  - Single-operator COV = 4.4 % (Bulk), 4.3% (Surface)
  - Multi laboratory COV = 13.2 % (Bulk), 11.5% (Surface)
  - Curing/conditioning a key issue

![](_page_12_Picture_9.jpeg)

![](_page_12_Picture_10.jpeg)

### **Precision and Bias**

![](_page_13_Picture_1.jpeg)

- Bias "the difference between a population mean of the measurements or test results and an accepted reference or true value" (Bainbridge 1985).
- Precision is the "spread of the data ... attributable to the statistical variability present in the sample" (Debanne 2000).

![](_page_13_Picture_4.jpeg)

• Bias and precision combine to define the performance of an estimator.

## **Overall Study Approach**

![](_page_14_Picture_1.jpeg)

- To provide precision and bias data for AASHTO TP119 and AASTHO T358
- Phase A: Identify participating labs and sample preparation for Phase C (1 month)
- Phase B: Develop and deliver training tools (2 months)
- Phase C: Controlled Curing to Isolate Testing Operator and Testing Equipment Variation (4 months)
- Phase D: Curing in Participating Laboratories to Include Curing Variation (5 Months)

### **Resistivity Testing**

![](_page_15_Picture_1.jpeg)

![](_page_15_Picture_2.jpeg)

### THERE IS NO PLACE LIKE HOME

Will be done at your home labs

Goal is to have trainings and then evaluations

Special physical testing tools

### Phase A Participating Labs and Sample Prep

- Link to fill in the participation form <u>https://forms.gle/qTUHR8cgZuFhfKu17</u>
- We need to know the labs that will be involved in testing
- 10 resistivity calibration devices are ready, shipped in October. (More can be made if desired)
- Concrete samples need to be cast but we need to know how many samples are being made and where they are going

![](_page_16_Picture_5.jpeg)

### Resistivity Precision & Bias Study Participation

Please submit this form if you are interested to join the precision and bias study for the resistivity testing. For any questions, email krishna.chopperla@oregonstate.edu

### **Phase B – Training Tools**

![](_page_17_Picture_1.jpeg)

![](_page_17_Picture_2.jpeg)

## Phase B – Training Tools

![](_page_18_Picture_1.jpeg)

#### **Develop and deliver training tools**

- A video as the training tool for performing the test
- A video/webinar factors that impact testing
- Calibration cell to make sure folks are doing this correctly
- Worksheet to enter the data will be shared with the participating laboratories
- Test of knowledge at the end

![](_page_18_Picture_8.jpeg)

### Phase C – Test Equipment, Operator, Well Cured Sample

![](_page_19_Picture_1.jpeg)

#### • After online webinar

- Review AASHTO TP119/358
- Testing the calibration cell
- Mature (56d) samples will be sent to the labs (to minimize curing variation)
- 2 mixtures bridge deck and pavement
- Results from the labs will be compared to OSU results
- Results will be compared with other testing labs
- Determining
  - identifies equipment variation
  - Identifies operator variation
  - Identifies pooled variation when curing is not varied

### Phase D – Varied Sample Curing and Conditioning

![](_page_20_Picture_1.jpeg)

#### **Curing in Participating Laboratories to Include Curing Variation**

- Prepared samples will be sent at an early age (36-72 hours)
- Curing and conditioning (ask you to return solutions)
  - Option A 5-gal bucket with simulated pore solution
     7.6 g/L NaOH (0.19 M); 10.64 g/L KOH (0.19 M); 2 g/L Ca(OH)<sub>2</sub>.
  - Option B Seal cured
  - Option D Lime water bath
- A precision statement
  - for the testing equipment and operator
  - curing and conditioning

### **Output from the study**

![](_page_21_Picture_1.jpeg)

#### AASHTO TP 119 (T358)

- precision and bias statement
- help consideration as a full test standard
- any final modifications to the provisional standard

Total Variation Variation Production Variation Testing Variation **Production Variation** 

Helps to set specification limits that are

realistic and capture production variation

### **Calibration Samples**

![](_page_22_Picture_1.jpeg)

- In 2008 we stated that calibration/reference devices were needed
- Some suppliers have made some items but we needed to develop the calibration cell at OSU to verify the equipment is setup correctly
- Specifically:
  - Correct sponges and the solution used
  - Electrical connections are not faulty

![](_page_22_Figure_7.jpeg)

• Real examples of issues

### **Calibration Samples**

![](_page_23_Picture_1.jpeg)

![](_page_23_Figure_2.jpeg)

![](_page_23_Picture_3.jpeg)

![](_page_23_Picture_4.jpeg)

### **Known Materials (low)**

![](_page_24_Picture_1.jpeg)

![](_page_24_Figure_2.jpeg)

- Tested known sample
- Actual Impedance 589 ohms

![](_page_24_Figure_5.jpeg)

Jason.Weiss@oregonstate.edu

### **Known Materials (high)**

![](_page_25_Picture_1.jpeg)

![](_page_25_Figure_2.jpeg)

consistent measurements

### in resistivity measurement • Effect of using defective wires

#### Effect of conductive solution for sponges • Using DI water instead of conductive solution (simulated

• Thickness: 0.55", 0.35", 0.04"

Using sponges thicker than 0.35" can cause > 4% change in measured resistivity (typically 1%)

pore solution or lime water) can cause up to 8% increase

Can cause fluctuations in measurements and effect the

## • Effect of using different sponges (Corrected)

**Resistivity calibration** device

![](_page_26_Picture_8.jpeg)

![](_page_26_Picture_9.jpeg)

![](_page_26_Picture_10.jpeg)

Sep 27, 2022

![](_page_27_Picture_0.jpeg)

![](_page_27_Picture_1.jpeg)

- Concrete Quality related to water content and connectivity of pores
- Resistivity (Formation Factor) related to water content and connectivity of pores
- PEM Enabled different groups to become familiar with resistivity
- Now that we are familiar there is an opportunity to tighten up how we are testing – education and verification
- Huge value in proper calibration cells
- We will conduct a precision and bias study Looking for testing labs

### **Fresh Concrete Study**

![](_page_28_Picture_1.jpeg)

- Travel to Iowa
  - SAM testing
  - V- Kelly Testing
  - Box Testing

![](_page_28_Figure_6.jpeg)
