### Timing, air content, and troweling

# Reinforcement in walls

• Not enough

![](_page_7_Picture_2.jpeg)

### Reinforcement in slabs

• For slabs, more than 0.10% steel reinforcement they are prone to increased random cracks

#4 rebar at 42"o.c. in 5-inch slab = 0.10%

- Sawcut to 1/3 slab depth if reinforced
- If more than 0.50% steel reinforcement, then joints are not necessary. The slab will have a number of very tight cracks
  - Similar to continually reinforced pavement
