

Concrete Pavement Preservation

Timely and Effective Treatments for Preserving and Restoring the Condition of Concrete Pavements

Dan King, P.E.

Technology Center

Outline

- Introduction
- Getting Started
- Preservation Treatments
- Local Project Examples

Acknowledgments & Further Information

- Thanks to Iowa DOT & ICPA for their support of this program
- Much more information is available from the CP Tech Center:
 - <https://cptechcenter.org/pavement-preservation/>
- Special thanks:
 - Jerod Gross, Snyder & Associates
 - Kurt Smith, APTech
 - Max Grogg, APTech
 - Prashant Ram, APTech
 - Kelly Smith, APTech
 - Dale Harrington

Introduction

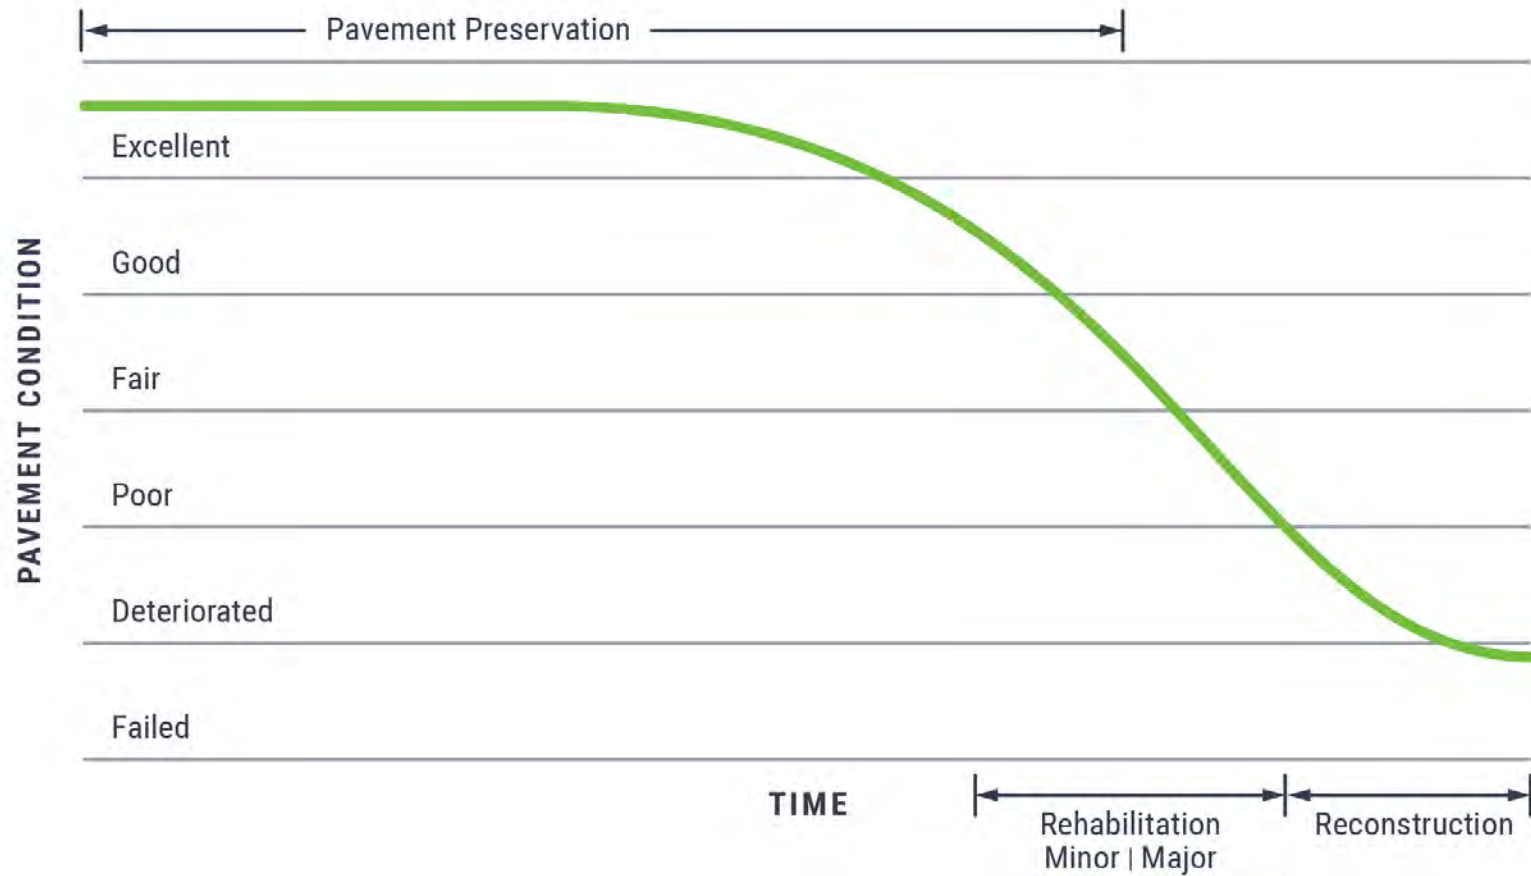

What is Pavement Preservation?

- Proactive approach to managing pavement assets
- Focus on extending pavement life and maintaining or restoring functional condition
- Accomplished using a collection of preservation and rehabilitation treatments

A more recent definition:

Concrete pavement preservation is a strategy of extending concrete pavement service life for as long as possible by arresting, greatly diminishing, or avoiding pavement deterioration processes.

What is Pavement Preservation?

What is Pavement Preservation?

- Keys to successful projects:
 - Target the right pavement for receiving preservation treatments
 - Target the right time in the life of the pavement for the preservation treatments
 - Install the treatment effectively so the full benefits are achieved

Concrete Pavement Preservation

- Benefits
 - User satisfaction
 - Smoothness
 - Safety
 - Fewer traffic disruptions
 - Long-term cost savings
 - Sustainability
- Network-level smoothness data from KY after adoption of a diamond grinding program:

Concrete Pavement Preservation

Primary Treatments:

- Crack sealing
- Diamond grinding
- Diamond grooving
- Dowel bar retrofit
- Full-depth repair
- Joint resealing
- Partial-depth repair

Additional Treatments:

- Concrete overlay
- Cross stitching
- Slab stabilization
- Slab jacking
- Slot stitching
- Retrofitted edge drains

Concrete Pavement Preservation

- Typical performance of selected preservation treatments:

Treatment	Expected Performance (treatment life)
Slab stabilization	5 to 10 years
Partial-depth repairs	10 to 20+ years
Full-depth repairs	20+ years
Dowel bar retrofit	15 to 20+ years
Cross stitching	10 to 20+ years
Diamond grinding	15 to 25+ years
Joint resealing	8 to 16+ years

Getting Started

Evaluating Pavement Condition

- How do we determine if preservation is right for a project and which preservation treatments we should use?
 - Qualitative methods
 - Identify deterioration/distresses
 - Determine causes
 - Quantitative methods
 - Quantity estimates
 - Deterioration rates
 - Life cycle cost analysis

Pavement Distress Survey

- Provides fundamental information on pavement performance
- General indicator of pavement deficiencies and needs
- Identifies needs for additional field testing

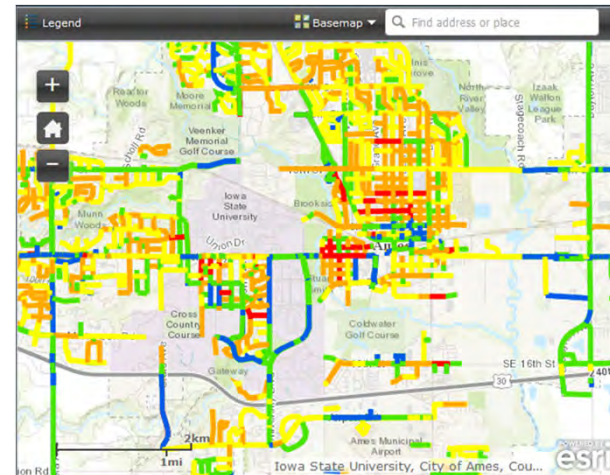

Pavement Distress Survey

- Document pavement condition
- Identify types of distress
- Group areas of similar performance
- Gain insight into causes of deterioration
- Identify additional testing needs
- Identify possible treatment alternatives
- Identify repair areas and quantities

Data Collection

- Automated pavement condition data can be used to identify candidates for preservation
- Allows for planning and programming of preservation activities at a network level

Data Collection

- Example of trigger values for planning preservation activities:

Performance Indicator	Trigger Value	Limit Value	Repair
Trans. Cracking	1.5-2.5% of slabs cracked	5-15% of slabs cracked	Partial, Full, Dowel Bar Repairs
Joint Deterioration	2.0-4.0% of joints	15-20% of joints	Partial-Depth Repair
Joint Faulting	1/8 inch	3/8 – 1/2 inches*	Dowel Bar Retrofit
Roughness	90 in/mi	170 in/mi*	Diamond Grinding

Testing and Sampling

- More detailed information may also need to be collected on-site to inform treatment selection and strategy
- Non-destructive testing can provide many kinds of information
 - Layer thicknesses, material properties
 - Load transfer
 - Location of voids, rebar

Testing and Sampling

- Field sampling may not always be necessary, but can provide valuable information
 - Uncertainty in condition, deterioration depth, thickness of older pavement layers

Preservation Treatments

Slab Stabilization and Slab Jacking

- Pressure insertion of polyurethane or grout to fill voids underneath slabs (stabilization) or to raise slabs (jacking)

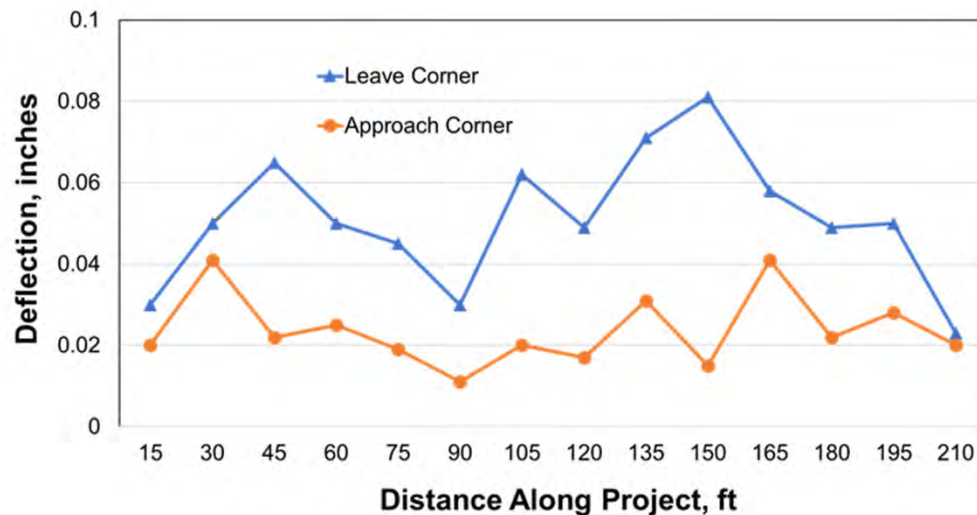

Slab Stabilization

- Addresses issues such as loss of support and pumping/erosion of subbase **before** they result in significant distresses like faulting or cracking

Slab Stabilization

- Loss of support can be identified from deflection testing, GPR, or visual observation

Slab Jacking

- Best for addressing localized areas of settlement
 - Fill areas, culverts, bridge approaches
 - **Not** a method for addressing joint faulting

Partial-Depth Repairs

- Removal & replacement of shallow areas of deteriorated concrete
 - Depth up to 1/2 of slab thickness
- Frequently used to address joint spalling and deterioration

Type 1: Localized repairs
Type 2A: Joint repairs > 6 ft
Type 2B: Crack repairs > 6 ft

Partial-Depth Repairs

- What makes a good candidate for PDR?
 - Spalling caused by incompressible materials
 - Joint deterioration caused by de-icing chemicals
 - Surface deterioration tied to poor curing or finishing

Partial-Depth Repairs

- When is PDR not the right solution?
 - Deterioration greater than 1/2 slab thickness
 - Spalling due to working cracks, dowel bar misalignment, etc.
 - Joint deterioration caused by D-cracking or reactive aggregates
 - In this case, PDR is at best a stopgap measure

Partial-Depth Repairs

- SUDAS 7040.3.03 & Iowa DOT 2530:

Partial-Depth Repairs

- Repair boundaries
 - Determine extent of deterioration by sounding
 - Extend 3 inches outside of unsound areas
 - Combine spalls if closer than 24 inches

Partial-Depth Repairs

- Pavement removal
 - Saw and patch
 - Chip and patch
 - Mill and patch

Partial-Depth Repairs

- Milling options:

“V” Shape Milling Head and Pattern

Rock Saw and Rounded Pattern

Vertical Edge Mill Head and Pattern

Partial-Depth Repairs

- Select repair materials based on curing time, placement conditions, size and depth of repair, performance requirements
 - Conventional or high early strength PCC
 - Other types of rapid-setting cements
 - Polymer-based materials
 - Bituminous materials

Partial-Depth Repairs

- Construction process
 - Establish a clean, roughened surface
 - Prepare compressible joint re-former for patches at joints
 - Joints can also be re-established by sawing

Partial-Depth Repairs

- Apply bonding agent (cement or epoxy grout) to patch area
 - Ensure the bonding agent doesn't set or dry out
- Place, finish, and cure the repair material
 - Grout edges of the patch
- Re-saw joints (if not using joint re-former) and seal joints
 - Must saw through the full depth of the patch

Partial-Depth Repairs

- Treatment life: 10 to 20+ years
 - Very sensitive to the construction process – patches can last a long time, but failures can occur quickly!

Full-Depth Repairs

- Tried and true method of concrete pavement repair
- Best for addressing intermittent structural distresses

Candidate JCP Distresses

Transverse Cracking (M, H)

Longitudinal Cracking (M, H)

Corner Breaks (L, M, H)

Spalling (M, H)

Blowups (L, M, H)

D-Cracking or ASR Deterioration*

* *Stopgap measure*

Full-Depth Repairs

- SUDAS 7040.3.02 & Iowa DOT 2529:

- ① Patches on roadways with quarter point jointing will be similar to third point jointing details.
- ② Minimum distance between existing joint and patch is 6 feet. If distance is less than 6 feet, extend patch to existing joint.
- ③ If subgrade or subbase material is required below patch, bring material to a level 2 inches below bottom of existing pavement.
- ④ BT, KT, or L joint depending on pavement thickness and pouring sequence.

Full-Depth Repairs

- Capable of extended treatment life of 20+ years
 - Make sure to restore load transfer in doweled pavements
 - Consider the potential tradeoff between using high early strength PCC mixes and the longevity of the repair
 - Cure!

High Early Strength Mixes for Patching

- Class M mix (Iowa DOT IM 529 & section 2529)
 - About 30-40% higher Portland cement content
 - Minimal-to-no use of SCMs
 - Include calcium chloride for overnight opening (5-10 hours)
 - Sacrifices some durability for opening strength in < 24 hours
- Mixes with other types of rapid setting cements (e.g. CSA cement)
 - Combines high early strength with excellent long-term durability
 - Potential for improved patch performance
 - May be logistically challenging to use
 - Expensive

Dowel Bar Retrofit

- Installation of dowel bars across transverse joints or cracks
- Improves load transfer, reduces deflections, and corrects and prevents faulting
- Typical repair: 3 to 4 bars in each wheel path

Dowel Bar Retrofit

- SUDAS 7040.3.10:

Dowel Bar Retrofit

- Slot cutting
- Slot preparation
- Dowel bar placement
 - Chairs and compressible insert
- Placement of patching material
- Re-saw joint/crack

End View

Side View

Dowel Bar Retrofit

- Treatment life: 15 to 20+ years
- Usually combined with diamond grinding to restore and improve pavement smoothness

Cross Stitching and Slot Stitching

- Repair methods for longitudinal cracks and joints

Diamond Grinding (and Grooving)

- Diamond grinding
 - Removal of a thin layer of the concrete surface
 - Improves pavement smoothness, surface texture, and noise
- Diamond grooving
 - Creation of channels to reduce potential for hydroplaning

Diamond Grinding

- Can be constructed under mobile single lane closures
- Typical 4 ft grinding head (3 passes/lane)
- Slurry removal process in urban areas

Diamond Grinding

- Blade design:

Parameter	Range	Hard Agg	Soft Agg
Groove Width	0.09 – 0.15 in	0.09 – 0.15 in	0.09 – 0.15 in
Land Area	0.07 – 0.13 in	0.07 – 0.11 in	0.09 – 0.13 in
Depth	0.04 – 0.12 in	0.04 – 0.12 in	0.04 – 0.12 in
No. of Blades	50 – 60/ft	53 – 60/ ft	50 – 54/ft

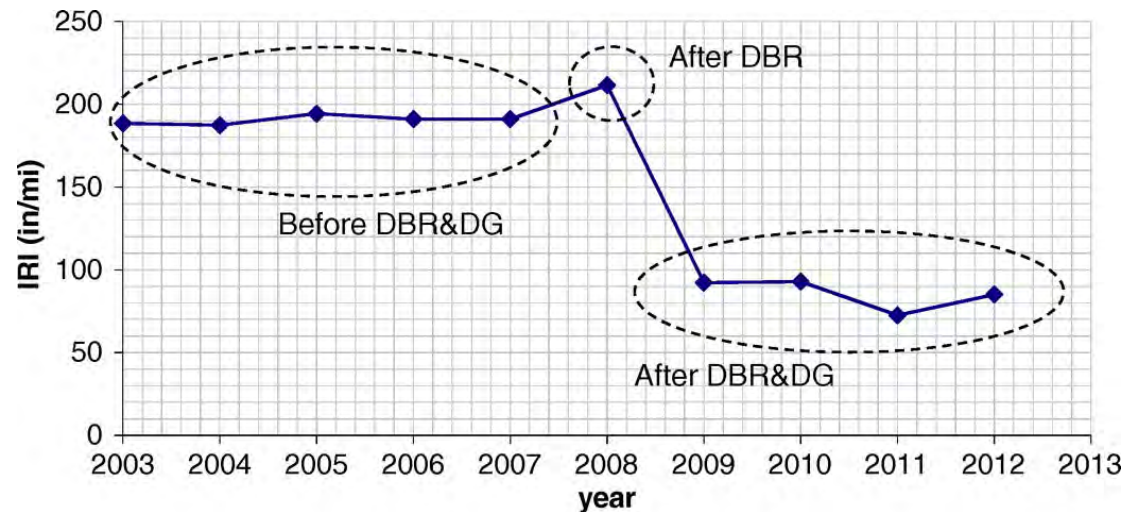

Diamond Grinding

- Feathering adjacent to curb using a smaller grinding machine:

Diamond Grinding

- Typically reduces pavement roughness by 15-60%
 - DBR is necessary to truly correct faulting and to ensure the smoothness benefits are long-lasting

Diamond Grinding

- Combines well with other preservation treatments
 - Smooths patching and other irregularities into a consistent surface
- Can have a significant impact on **sustainability** of the pavement
 - Restoration of pavement smoothness without new using new paving materials
 - Smooth roads improve fuel efficiency and reduce emissions
 - Grinding exposes new concrete to sequester additional CO₂

Next Generation Concrete Surface (NGCS)

- Ultra low-noise surface consisting of flush grinding and grooving

Joint Re-sealing and Crack Sealing

- Goals
 - Reduce infiltration of moisture and deicing chemicals
 - Prevent intrusion of incompressible materials
- Variety of materials may be used for sealing
 - For re-sealing, usually hot-poured asphalt or silicone sealant
- “Sealing” vs “Filling”

Joint Re-sealing and Crack Sealing

- Treatment life: 8 to 16+ years
- Caution with use of backer rod in cold climates:

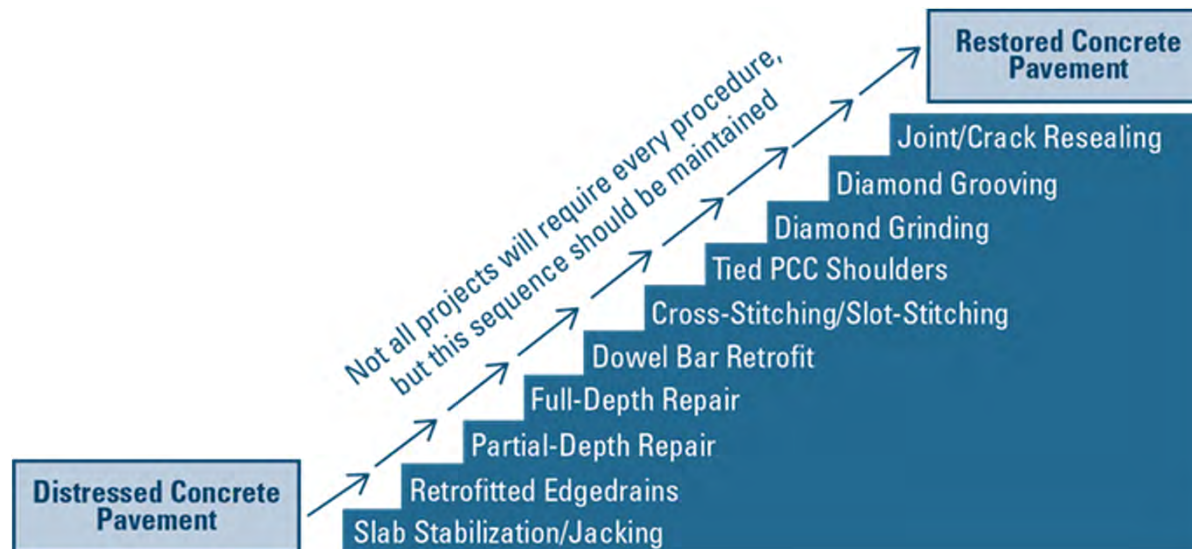

Strategy Selection

- Variety of methods for informing choice of treatment strategies
 - Economic
 - Benefit-cost ratio analysis (BCR)
 - Life-cycle cost analysis (LCCA)
 - Sustainability
 - Life-cycle assessment (LCA)
 - Sustainability rating systems

Strategy Selection

- Construction sequencing
 - Preservation activities can be applied concurrently
 - Proper sequencing is important to maximize the effectiveness of the individual treatments

Local Project Examples

Bowling Street, Cedar Rapids

Background

- 2-mile corridor, 8,000 vpd
- Paving for Progress
- 1979 construction (no dowels)
- Transverse joint faulting
- Safety improvements needed (4 to 3 lane conversion, RR crossing)

Pavement evaluation

- FWD testing
 - Confirmed areas of load transfer inefficiency
 - Confirmed candidate for dowel bar retrofit
- Coring
 - Confirmed deterioration was limited to surface

Bowling Street, Cedar Rapids

Preservation Strategies

- Dowel bar retrofit
 - Did not install in bike lanes
- Cross stitching
- Partial-depth repairs
- Full-depth repairs
- Diamond grinding
- Joint refilling

Bowling Street, Cedar Rapids

- Several preservation treatments
- 4 lane corridor allowed for effective construction staging
- Treatments were properly identified during the design process
- Pre-arranged location for diamond grinding slurry

Kiwanis Avenue, Sioux Falls

Background

- 2-mile corridor
- 14,000 – 18,000 vpd
- 1991-1994 construction (no dowels)
- 8" – 10" PCC
- Joint deterioration & transverse joint faulting

Pavement study

- Cores showed distress limited to upper 1/2

Kiwanis Avenue, Sioux Falls

Pavement study

- FWD analysis
- Petrography
 - Lower air content & presence of long-term saturation

Normal entrained air voids

Entrained air voids filled with ettringite

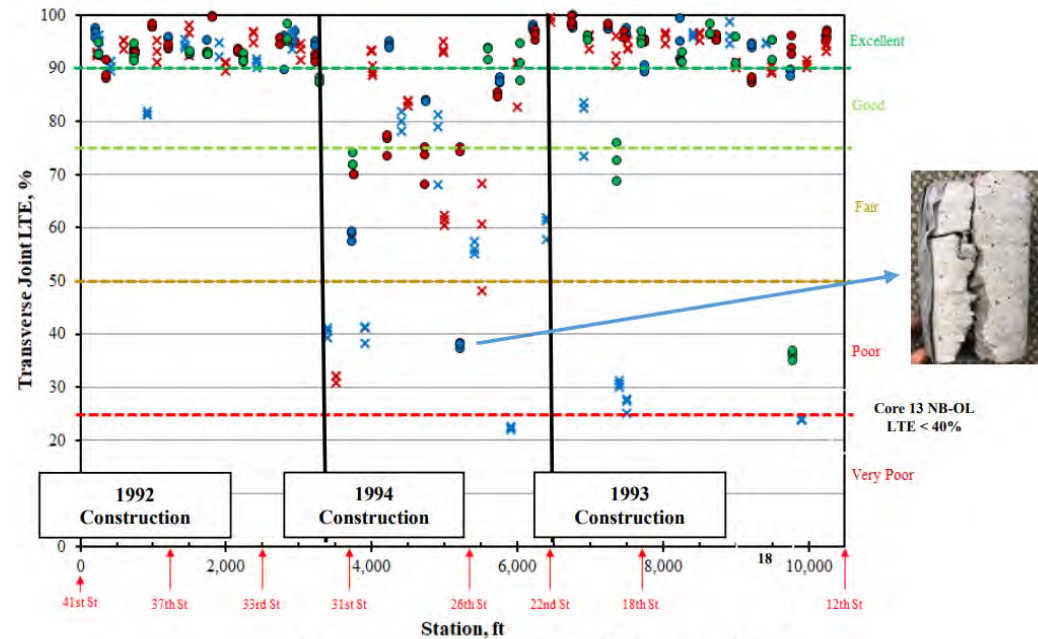

Figure 6 – Load Transfer Efficiency Profile

FWD analysis by Applied Pavement Technology, Inc.
 Petrography performed by American Engineering Testing, Inc.

Kiwanis Avenue, Sioux Falls

Preservation Strategies

- Full-depth repairs
 - Accelerated mixes in intersections
- Partial-depth repairs
 - 3U58M mixture
- Diamond grinding
 - Re-sounding of PDRs after grinding
- Joint re-filling

Kiwanis Avenue, Sioux Falls

- Improved pedestrian access and signal crossings
- Improved PCI from 73 to 90

Typical Treatment Costs

- Iowa Public Works Service Bureau
 - Bid Tabulation Report
 - Preservation treatments are in the 7040 range of bid items

PWSB
Iowa Public Works Service Bureau

HOME | BID TABULATION REPORT

Bid Tabulation Report

The Bid Tabulation Report provides an analysis of accepted bids from contractors to cities all across Iowa. The data is broken down according to the bid item codes based on the SUDAS Specifications Manual, and further separated by detail (size, type, thickness, etc.) as needed. The data shown on this landing screen is a summary of bids received across all years. You may right-click on a given item, highlight "drill-through," and click "details" to see the underlying line items for each code, along with a multi-year breakdown of the unit costs of those items.

All data contained in this report has been submitted voluntarily. To contribute your city's bids, click this [link](#), which will open an email in your default browser. For a video tutorial on how to use the report, click [here](#).
